### **Geophysical Logs for Wells in the Vicinity of the Subsurface Disposal Area**

## **Appendix C**

### **Geophysical Logs for Wells in the Vicinity of the Subsurface Disposal Area**

Appendix C shows graphically the depth and thickness selections for the A-B, B-C, and C-D interbeds for wells in the vicinity of the Subsurface Disposal Area that were evaluated in this analysis. The data used to select the interbeds were obtained from INEEL and USGS logs dating from 1963 to 2003. Logs were recorded by different borehole geophysical tools. Natural gamma, neutron, caliper and density data were evaluated for selection of interbed depth and thickness.

Primarily natural gamma and caliper data are presented with the top and bottom selections for the A-B, B-C, and C-D interbeds. In some instances, only the top of the interbed is selected because of an absence in data (e.g., well not drilled deep enough). Smoothed natural gamma data, as well as natural gamma 21-point and/or 41-point average data, are included for a select number of wells. The date that the specific variable was recorded via log is included in the graph legend.

Morrison Knudsen Corporation logs were used in the depth and thickness selections for RWMC-GAS-V-081 (10V).
